AMENDMENTS TO THE CLAIMS

This listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims:

1. (previously presented) A method comprising:

modeling neural activity as single equivalent current dipoles (ECD's);

calculating a best fit dipole coordinate for each dipole;

computing a confidence interval for each dipole coordinate; and

displaying the confidence intervals in an overlay on a three-dimensional image obtained through the use of either magnetic resonance imaging (MRI) or computerized tomography (CT).

- (previously presented) The method of claim 1, wherein the step of computing a confidence interval includes computing an error ellipsoid using a Singular Value Decomposition.
- 3. (canceled)
- 4. (previously presented) The method of claim 1, wherein the step of modeling includes assuming the geometric and conductive properties of cardiac or cortical tissue.
- 5. (previously presented) The method of claim 4, wherein the step of computing a confidence interval includes the step of determining field distributions for a best fit dipole coordinate and for a modified best fit dipole coordinate.
- 6. (previously presented) The method of claim 5, wherein the step of computing a confidence interval includes the step of computing the difference field distribution.
- 7. (previously presented) The method of claim 6, wherein the step of computing a confidence interval includes the step of performing a signal to noise ratio analysis.

- 8. (previously presented) The method of claim 1, and further comprising defining a Cartesian coordinate system.
- 9. (canceled)
- 10. (canceled)
- 11. (previously presented) An apparatus comprising:

a detector;

a processor adapted to receive data from the detector, the processor capable of using the data to calculate a best dipole coordinate and a confidence interval;

an imaging source in communication with the processor; and

a display in communication with the processor and adapted to display the confidence interval in three dimensions relative to a three-dimensional anatomical image, wherein the three-dimensional anatomical image is obtained through the use of the imaging source.

- 12. (canceled)
- 13. (previously presented) The apparatus of claim 11, wherein the imaging source is an MRI unit.
- 14. (previously presented) The apparatus of claim 11, wherein the imaging source is a CT unit.
- 15. (previously presented) The apparatus of claim 11, wherein the detector comprises electroencephalogram sensors.
- 16. (previously presented) The apparatus of claim 11, wherein the detector comprises magnetoencephalogram sensors.

17. (previously presented) A method comprising:
measuring a plurality of electrical or magnetic signals;
calculating a best fit dipole coordinate for each signal;
computing a confidence interval for each dipole coordinate; and

displaying the confidence interval on a three-dimensional anatomical map, wherein the confidence interval is displayed in its anatomical position in three dimensions.

- 18. (previously presented) The method of claim 17, wherein the step of computing a confidence interval includes computing a confidence ellipsoid axes from estimated noise level and different fields strengths.
- 19. (previously presented) The method of claim 17, wherein the step of displaying includes the step of receiving a digital image.
- 20. (previously presented) The method of claim 17, wherein the step of computing a confidence interval includes the step of computing a confidence volume.
- 21. (previously presented) The apparatus of claim 13, wherein the detector comprises electroencephalogram sensors.
- 22. (previously presented) The apparatus of claim 14, wherein the detector comprises electroencephalogram sensors.
